Requests

requests

- Illuminate\Http\Request

- $request->input('name')
  - 数组获取
    $name = $request->input('products.0.name');
    $names = $request->input('products.*.name');
  - $request -> input("products.name") //json 数据
  - $name = $request->input('name', 'Sally');// 默认参数

- 获取request path
  $uri = $request->path();

- is 函数 验证 request path 满足是否满足pattern
  ```
  if ($request->is('admin/*')) {
      //
  }
  ```

- $method = $request->method() 或者直接判断 $request->isMethod("post")

- To retrieve the full URL for the incoming request
  // Without Query String...
  $url = $request->url();

  // With Query String...
  $url = $request->fullUrl();

- $request ->all 方法 所有 input data

- 如果有name input 可以使用 $request->name
  ```
  if ($request->has('name')) {
      //
  }
  ```

- only 和except
  - $input = $request->only(['username', 'password']);
    返回的如果username 键没有 将会返回 'username' => null
    如果想 $input = $request->intersect(['username', 'password']);
    将不会返回没有值得键

- The flash method on the Illuminate\Http\Request class will flash the current input to the session so that it is available during the user's next request to the application

  $request->flash();
  - $request->flashOnly(['username', 'email']);
    $request->flashExcept('password');

- redirect 的时候带上参数 flash
  return redirect('form')->withInput();

  return redirect('form')->withInput(
      $request->except('password')
  );

- $username = $request->old('username');

  <input type="text" name="username" value="{{ old('username') }}">

  $value = $request->cookie('name');

- return response('Hello World')->cookie(
      'name', 'value', $minutes
  );
  - return response('Hello World')->cookie(
        'name', 'value', $minutes, $path, $domain, $secure, $httpOnly
    );

- file
  - $file = $request->file('photo');
    $file = $request->photo;
  - ```
    if ($request->hasFile('photo')) {
        //
    }
    ```
  - ```
    if ($request->file('photo')->isValid()) {
        //
    }
    ```
  - $path = $request->photo->path();

    $extension = $request->photo->extension();
  - $path = $request->photo->storeAs('images', 'filename.jpg');

    $path = $request->photo->storeAs('images', 'filename.jpg', 's3'); // s3 是disk 目录
  - $path = $request->photo->store('images');
    $path = $request->photo->store('images', 's3');
